

FlameGard® 5 UV/IR Flame Detector

Ultraviolet and infrared flame detection provides high immunity to false alarms

Description

The FlameGard 5 UV/IR Flame Detector is designed to detect fires and provide alarm outputs directly from the detector while maintaining false alarm immunity.

The FlameGard 5 UV/IR Flame Detector detects fires by monitoring in both the ultraviolet and infrared (UV & IR) spectral ranges, making it highly immune to false alarms caused by lightning, arc welding, hot objects and other sources of radiation.

Other features of the FlameGard 5 UV/IR Detector include three alarm/fault relays, and an RS-485 serial output with Modbus RTU protocol for linking up to 128 detectors in series or 247 with repeaters. The RS-485 and HART outputs provide status, alarm, fault and other information for operation, troubleshooting or programming of the units. HART enables this feature without the need for rewiring.

The continuous optical path monitoring (COPM) self test feature checks both the optical path integrity (window cleanliness) and the detector's electronic circuitry once every minute.

Features and Benefits

Wide field of view enables greater fire detection coverage

Event logging stores fault and alarm history

4-20 mA stepped output is the industry standard for remote alarm and fault indication

Modbus and HART user interface provides complete status and control capability in the control room

Wide operating temperature range permits operation at higher ambient temperature

Continuous Optical Path Monitoring (COPM) checks the optical path integrity and the detector's electronic circuitry once every minute

Three SPDT high-current programmable relay outputs provide immediate and time-delayed relay outputs for alarm, warning and fault conditions
